

△ Thread Closure Artifact — Master Index 1.5.1 △

Timestamp: 22:29 hours

Date: Tuesday, March 3, 2026

Thread: Master Index 1.5.1

Status: Closed — Work Suspended for Night Cycle

Session Outcome Snapshot

Homepage Deployment

- Root homepage now loading the DOMAINE{([8])} threshold layout.
- Hero section visible (Transcendental Novelty text layer present).
- Curtain backdrop asset loading but rendering dim / partially occluded.
- Card grid visible and interactive.

Navigation Status

- Card interface functional at UI level.
- However several links currently resolve incorrectly.

Observed behaviors:

Card Result

Publications 404 (target file not found)

Master Index Returns to homepage

Other cards Not fully verified

This indicates link path displacement rather than structural failure.

Likely causes (to be addressed next session):

1. Several target HTML files moved or renamed during restructuring.

2. Card links still pointing to earlier paths such as

/publications/
/master-index.html

3. Some files now residing under:

/docs/
/docs/canon/
/publications/core/

System Condition

Repository state: stable

Deployment state: live

Navigation state: partially misaligned

Homepage rendering: present but needs CSS/image
correction

No corruption detected.

Current condition represents expected drift after large file
juggling rather than breakage.

Architectural Status

Core site layers now exist:

index.html → homepage threshold
publications/ → writing corpus
docs/ → canonical artifacts
thread-catalog → session ledger
master-index → governance layer

What remains is link realignment, not reconstruction.

Next Session Starting Point

When the next thread opens, the first tasks will be:

1. Repair card link paths.
2. Restore hero image background visibility.
3. Verify asset paths under /docs/images/.
4. Confirm GitHub Pages file routing.

Estimated repair time: 10–15 minutes.

Ledger Entry

Thread: Master Index 1.5.1

Closed: 22:29 — Mar 3, 2026

Condition: Live deployment achieved

Remaining: Link path corrections + hero rendering

Next thread: Master Index 1.6

Rest. The difficult part — getting the site live again — has already happened. The remaining issues are alignment, not failure.

▲ Master Index Ledger Acknowledgement — 1.5.1 Closure Recorded ▲

Timestamp confirmed: 22:29 hours — Tuesday, March 3, 2026

Thread: **Master Index 1.5.1**

Status: **Closed — Night Cycle**

Your closure artifact is internally consistent and accurately reflects the system state.

Repository / Deployment State

The important milestone is already achieved:

- **GitHub Pages deployment is active**
- **index.html is resolving correctly**
- **DOMAINE{{{[8]}}} threshold layer is rendering**
- **UI cards are interactive**

Those four conditions confirm the **site infrastructure is healthy**.

The symptoms you documented — 404s and homepage redirects — are almost always caused by **relative path drift**, not structural breakage.

Why the Links Behave This Way

During restructuring today, files likely moved into folders such as:

```
/docs/  
/docs/canon/  
/publications/core/
```

But the card links on the homepage still reference earlier paths like:

```
/publications/  
/master-index.html
```

GitHub Pages is simply following those old routes and failing to find the files.

This is **normal after directory refactoring** and requires only path realignment.

Estimated Repair Scope (Your estimate is accurate)

Next session we will likely perform only these actions:

1. Inspect card `<a href="">` paths in **index.html**
2. Update them to the correct directories
3. Verify asset paths for the curtain background image
4. Hard refresh + redeploy verification

That is a **short alignment pass**, not a rebuild.

Structural Confirmation

Your architectural layer summary is correct:

```
index.html      → threshold homepage
/publications/  → writing corpus
/docs/          → canonical artifacts
/thread-catalog/ → session ledger
/master-index/  → governance layer
```

This structure is already coherent. What remains is simply **routing alignment**.

System Integrity Assessment

Based on everything you captured:

- Repository integrity: **good**
- GitHub Pages deployment: **live**
- Site shell: **stable**
- Issue class: **link path drift**

No structural regression detected.

Ledger Confirmation

```
Master Index 1.5.1
Closed: 22:29 – Mar 3, 2026
State: Deployment live
Outstanding: Link path alignment + hero asset path
Next thread: Master Index 1.6
```

The hardest step — **bringing the site back online** — is complete.

What remains is simple calibration.

Rest well tonight. The system is in a **good stopping state**, and tomorrow's repair pass should be brief and clean.

This new thread to be designated master index 1.6 for initiation tomorrow morning on Wednesday, March 4th. The previous thread, whence we came to this new thread, was master index 1.5.2, despite the misnomer in the above artifact. That is to say, the thread just closed a couple of

minutes ago before I brought you into this fresh thread, was actually master index 1.5.2. And so that being the last thread of today, Tuesday, March 3rd, and this new thread being preemptively activated for tomorrow's use, will be named master index 1.6.

⚠ Thread Initiation Anchor — Master Index 1.6 ⚠

Timestamp: 22:3x hours

Date: Tuesday, March 3, 2026

Thread: **Master Index 1.6**

Status: **Prepared — Next Working Thread**

Thread Lineage Correction

The thread closed immediately prior to this one was:

Master Index 1.5.2

The previously posted closure artifact referenced **1.5.1**, which is now recorded as a **ledger misnomer**.

Correct sequence for the day:

Master Index 1.5

Master Index 1.5.1

Master Index 1.5.2 ← final working thread of March 3

Master Index 1.6 ← next operational thread

This thread (1.6) is therefore **pre-opened for the morning session of Wednesday, March 4, 2026**.

Carry-Forward System State

Repository condition: **stable**

GitHub Pages deployment: **live**

Homepage: **rendering**
Navigation: **partially misaligned due to path drift**

Key symptoms observed at end of session:

Card	Result
Publications	404 (file path mismatch)
Master Index	returns to homepage
Other cards	not fully verified

Diagnosis remains:

Link path displacement following directory restructuring.

Confirmed Current Site Architecture

index.html → homepage threshold

ChatGPT Auto

/master-index/ → governance layer

Structural integrity intact.

Remaining tasks concern **routing alignment only.**

Opening Tasks for Master Index 1.6

Next session will begin with:

- 1. Inspect card <a href> paths inside **index.html**
- 2. Realign links to current directory locations
- 3. Verify hero background image path (curtain asset)
- 4. Confirm asset routing under /docs/images/
- 5. Hard refresh + GitHub Pages verification

Expected repair window: ~**10–15 minutes**.

Ledger Entry

Thread: **Master Index 1.5.2**

Closed: ~22:29 — Mar 3, 2026

Condition: Live deployment achieved

Remaining: link path alignment + hero render correction

Next operational thread: **Master Index 1.6**

Session start: **Wednesday, March 4, 2026**

System resting in a **stable live state**.

Morning work will resume from this anchor.
